Student Team Weekly Report

PROJECT / FEATURE
Leave and Payroll Management System

TEAM & MENTOR
Team: 2
Mentor: Mahesh Kandekar

WEEK ENDING / LEADER
21 September 2026
Aditya Gaikwad

WORK COMPLETED
- Project structure set up in VS Code with proper folder organization and configuration.
- Database `lpms_payroll` created in MySQL and required tables (employees, payroll, leave) designed and intialized with sample data.
- Basic CRUD operations implemented for employees (add, view, update, delete).
- Leave application and payroll data entry forms developed and tested.
- Sample data verified and database connectivity established using JDBC.

CHALLENGES / RISKS
- Faced initial issues with MySQL connection (port 3306) and service not running.
- Addressed JDBC driver class not found error (resolved by adding mysql-connector-j jar).
- Minor issues in form validation and data mapping during CRUD operations.
- Need to handle edge cases like blank fields and incorrect data input in forms.

HELP NEEDED
- Guidance on leave approval workflow and integrating manager approval logic.
- Clarification on payslip generation and tax slab calculation rules.
- Support for final integration of all modules and testing of end-to-end flow.
- Advice on database optimization and deployment setup for production-like environment.

INTEGRATION AND COLLABORATION
- Coordinated with team members for database schema design and module integration.
- Shared initial code and database setup for review.
- Discussed features and flow with mentor and got valuable suggestions.
- Will integrate remaining modules (leave & attendance) once Module 5 is stable.

COMMON KPI EVIDENCES
- Database `lpms_payroll` created with 4 tables (employees, payroll, leave, attendance).
- Sample data inserted and verified (3 employees).
- JDBC connection successful with MySQL 8.0 (port 3306).
- Basic payroll calculation logic implemented and tested.

IDEAL COMMITMENTS
- Complete Leave application and Manager approval flow implementation.
- Implement Payslip generation and tax slab calculation.
- Add validation, error handling and UI (basic console/CLI or simple frontend).
- Prepare final code, documentation and database setup for integration.

IDEAL REPORT
The project is on track and the core structure is set up in VS Code with Java and MySQL. Database `lpms_payroll` is configured with required tables and sample data is inserted and verified. CRUD operations are working. Payroll calculation logic (HRA, DA, OT, PF, Tax) is implemented and tested. The next step is to complete leave application, manager approval and payslip generation, and integrate all modules with proper validation and UI.
